26.	<p>(i) Stable full filled electronic configuration</p> <p>(ii) N has a stable configuration since it has half-filled 2p-orbitals so it is reluctant to gain an electron. So, nitrogen has slightly positive electron gain enthalpy.</p> <p>(iii) Hydrogen has properties similar to the group 1 elements (alkali metals) and it also shows the properties of group 17 elements (Halogens). Hydrogen's similarity with two completely different groups of elements in the modern periodic table has made it difficult for scientists to place it in particular group and hence the position of hydrogen in the modern periodic table is not fixed.</p> <p>(iv) This is due to the increase in nuclear charge and decrease in atomic size, as a result of which shared electron pair can be attracted more towards itself.</p>	1x3	Pg-85, 87																								
27.	<p>(a)</p> <p>For the given reaction, 2A + B → C</p> <p>As per the Gibbs Helmholtz equation: ΔG = ΔH - TΔS</p> <p>Assuming the reaction at equilibrium, ΔG=0 ; So, ΔH=TΔS T=ΔH/ΔS T = (400 kJ mol⁻¹) / (0.2 kJ K⁻¹ mol⁻¹) = 2000 K</p> <p>Thus, reaction will be in a state of equilibrium at 2000 K.</p> <p>For the reaction to be spontaneous, ΔG must be negative. Hence, for the given reaction to be spontaneous, T should be greater than 2000 K.</p> <p>(b)</p> <p>ΔH : negative (- ve) because energy is released in bond formation</p> <p>ΔS : negative (- ve) because entropy decreases when atoms combine to form molecules.</p>	½ ½ 1 1	Pg-184																								

28.	(a) (i) All the given species contain same number of electrons (10). Hence, they are isoelectronic species.	1	Pg-96
	(ii) The increasing order of ionic radii is $Al^{3+} < Mg^{2+} < Na^+ < F^- < O^{2-} < N^{3-}$	1	
	(b) Because the number of protons are more than number of electrons and hence effective nuclear charge increases.	1

OR			
$2SO_{2(g)} + O_{2(g)} \rightarrow 2SO_{3(g)}$			
For the above reaction $\Delta n^{(g)} = 2 - (2+1) = -1$			
$\Delta U = \Delta H - \Delta n^{(g)}RT$			
$= -92.38 - (-1) \times (8.314 \times 298)$			
$= -92.38 + (8.314 \times 298)$

30	(a) $\lambda = h/mv$	1	Pg-27		
	(b) No,	$\frac{1}{2}$			
	Because of large masses, the wavelength associated with macroscopic object becomes so short that it can not be detected.	$\frac{1}{2}$			
	(c) $\lambda = h / (2mKE)^{1/2}$	$\frac{1}{2}$			
	$= \frac{6.626 \times 10^{-34}}{\sqrt{2 \times 9.1 \times 10^{-31} \times 3 \times 10^{-25}}}$	$\frac{1}{2}$			
	$= 1.2 \times 10^{-7} \text{ m}$	1			
	OR				
	$P = \frac{h}{\lambda}$	$\frac{1}{2}$			
	so, here we have to use formula	$\frac{1}{2}$			
	$\frac{P_A}{P_B} = \frac{\lambda_B}{\lambda_A}$				
Given, $P_B = \frac{P_A}{2}$					
and $\lambda_A = 5 \times 10^{-8} \text{ m}$					
so, $\frac{P_A}{P_A/2} = \frac{\lambda_B}{5 \times 10^{-8}}$	$\frac{1}{2}$				
$\lambda = 10^{-7} \text{ m}$					
hence, wavelength of B is 10^{-7} m	$\frac{1}{2}$
